

Creating a Historical Malaria Database

Lexa Koenig

Purpose

- Extract historical malaria data (cases, deaths, funding, etc.) from sources such as WHO, PAHO, and Rockefeller
- Combine data into single database with indicators by country
- Develop visualizations of specific to help inform malaria policymakers' decisions about anti-malaria interventions

Findings

- Reliable historical data difficult to find
- Consistency of data across and within organizational reports varies
- Country name and border changes are difficult to incorporate
- Reliability of modern data is questionable because of differing definitions of cases, deaths, etc.
